

ABSTRACT

Pivoted Device and Portable Computer

A pivot member supports a device on a placement plane when the device is placed on the plane. The pivot member acts as a pivot which allows the orientation of the device to be changed when the device is tilted by lifting its front end. When the lifted end is manually moved to rotate about the pivot and the device has the desired orientation, the lifted end is lowered so that the device is again placed on the placement plane allowing the orientation of the device to be changed.
